**Description:** K29-linked diUb is a native K29 linked di-Ub which can be used as a substrate for proteases that cleave the isopeptide linkage between two ubiquitin molecules. It can also be used to investigate mechanism of binding and recognition by proteins that contain ubiquitin-associated domains or ubiquitin-interacting motifs (UIMs). This product is formed by chemical ligation.

**Storage:**

Powder at -20°C; solution at -80°C. Please avoid multiple freeze/thaw cycles.

**Sample Preparation (Important!):**

- 1) Centrifuge the tube at 10,000 xg for 2 min to pellet the powder.
- 2) Dissolve the powder in a small amount of DMSO (e.g. 25 μg powder in 1 μL DMSO). Vortex the tube to completely dissolve the powder. Keep under room temperature for 5 min, and then centrifuge under room temperature at 10,000 xg for 2 min to collect solution to the tube bottom.
- 3) Add 49 μL colde buffer (such as 20 mM Tris, pH 7.2, 150 mM NaCl and 10% glycerol) directly into the tube bottom in once, and pipette up and down to mix (avoid generating bubbles and note the order of addition).
- 4) The stock solution is 0.5 μg/μL (29 μM).
